In spring 2016 we surveyed hundreds of data center professionals from around the world. Following is a summary of their storage pains and priorities.

How big is your storage footprint?

Who manages your storage footprint?

What storage management tools are you using most often?

What are the biggest storage pain points you have today?

OK, so what steps are you taking to address storage pain?

And if you are expecting relief to come from new technologies, which are you exploring right now?

What are the buying criteria that matter most when selecting new storage?

Bottom line: If you’re like the State of Storage study respondents, then you’re dealing with manageability and performance pain. There’s probably only one way you need to view storage differently, and find a platform that can guarantee the performance of your virtualized applications, integrate seamlessly (even across hypervisors) and scale-out with simplicity.

Sounds like you need Tintri. You can get hands-on with Tintri VMware storage right now, live, on-demand, and learn more about managing storage in a fraction of the time and money at try.tintri.com and tintri.com.
